Internet addiction and how it affects students' study habits

Panay News · 2 Jun 2023 · 10 · I By: Janette T. Delco, Teacher III Sigma central elementary school

In today's digital age, the internet has become an integral part of our daily lives. From social media and online gaming to streaming videos and browsing the web, students spend a significant amount of time online. While the internet provides numerous benefits, it can also lead to addiction, which can negatively impact students' study habits.

Internet addiction is characterized by excessive use of the internet, leading to various physiological and psychological symptoms. Students who are addicted to the internet often have trouble controlling their online behavior and spend long hours surfing the web, which can lead to a lack of sleep and poor academic performance.

Moreover, students who are addicted to the internet may find it challenging to concentrate on their studies or complete assignments on time. This can result in lower grades, decreased motivation, and increased stress and anxiety. In extreme cases, internet addiction can even lead to social isolation, depression, and other mental health issues.

To address internet addiction among students, it is essential for schools to educate students about responsible internet use and the potential consequences of excessive screen time. Parents also play a crucial role in monitoring their children's online activities and setting limits on screen time.

Furthermore, schools can implement technology-free zones or designated times for internet use, such as during breaks or after school hours. They can also provide counseling services or support groups for students struggling with internet addiction.

In conclusion, internet addiction can have a profound impact on students' study habits and academic performance. By raising awareness, setting guidelines, and providing support, schools and parents can help students develop healthy relationships with technology and succeed academically.(Contributed article)
