Plain Water The Best Choice for Health

New Straits Times · 10 Jul 2025 · C22

PLAIN WATER, also known as mineral water without sugar or additives, is an essential element in daily human life. The human body is made up of nearly 60 percent water, making it a fundamental component necessary for maintaining optimal health. Although often considered ordinary and less appealing compared to flavored beverages, plain water actually offers numerous benefits that should not be overlooked.

Plain water helps maintain body hydration. The body loses water daily through sweat, breathing, and urination. Therefore, consuming an adequate amount of water is crucial to ensure internal organs function properly. A lack of water can lead to fatigue, headaches, and other health issues such as constipation and dehydration.

In addition, plain water assists in the process of toxin removal from the body. When a person drinks enough water, the kidneys can effectively filter the blood and expel waste through urine. This indirectly helps prevent kidney-related diseases and digestive problems. Moreover, the skin will appear healthier, more radiant, and youthful, as water helps maintain skin moisture and elasticity.

In terms of weight management, plain water can help control appetite. Drinking water before meals can create a feeling of fullness, thereby reducing the tendency to overeat. Compared to sugary drinks that are high in calories, plain water contains no sugar or calories, making it the best choice for those aiming to live a healthy lifestyle. Many individuals who are trying to lose weight also make it a habit to drink water right after waking up.

Plain water also plays a role in improving brain function. Even mild dehydration can affect one's focus, memory, and mood. Therefore, by ensuring the body stays hydrated, individuals can think more clearly and remain energetic throughout the day.

In conclusion, plain water provides a wide range of health benefits for the human body. Although it may seem simple and unexciting, its advantages are substantial and far-reaching. Thus, we should all make it a daily habit to drink enough water in order to maintain long-term health. Remember, water is one of nature's most valuable and easily accessible gifts — make the most of it.
